Study the vegetation and terrestrial water cycles

 Current fleet of Earth Satellite missions holds an unprecedent potential to quantify Land Surface Variables (LSVs)

[Lettenmaier et al., 2015, Balsamo et al., 2018]

- Spatial and temporal gaps & cannot observe all key LSVs (e.g. RZSM)
- Land Surface Models (LSMs) provide LSV estimates at all time/location
- LSMs have uncertainties
- Through a weighted combination of both, LSVs can be better estimated than by either source of information alone [Reichle et al., 2007]
- Data assimilation

Spatially and temporally integrates the observed information into LSMs in a consistent way to unobserved locations, time steps and variables

Study the vegetation and terrestrial water cycles

LDAS-Monde: global capacity offline integration of satellite observations into a land surface model fully coupled to hydrology

LDAS-Monde involves

- Land surface model: ISBA-A-gs
- River routing system: CTRIP (CNRM version of Total Runoff Integrating Pathways)
- Data assimilation routines (SEKF, EnSRF*, PF)
- Satellite derived observations (SSM, LAI)

LDAS-Monde successfully validated at regional/continental scale

- Agricultural statistics (e.g. Dewaele et al., 2018, HESS)
- River discharge (e.g. Albergel et al., 2017, GMD, 2018, RS)
- In situ measurements of soil moisture (e.g. Albergel et al., 2018, RS)
- Evapotranspiration from GLEAM, Fluxnet2015 (e.g. Albergel et al., 2018, RS)
- Gross Primary Production from FLUXCOM (e.g. Tall et al., 2019, RS)
- Sun-Induced Fluorescence (vs. GPP, e.g. Leroux et al., 2018, RS, Tall et al., 2019, RS)

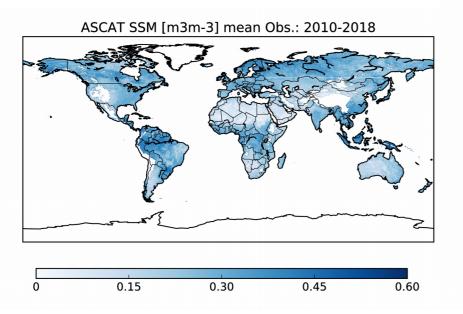

[*LDAS EnSRF: Bonan et al HESSD]

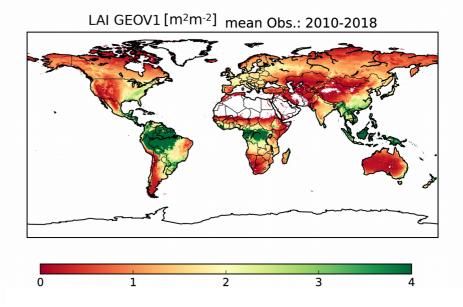

LDAS-Monde goes global

| Model | Domain | Atm. Forcing | DA Method | Assimilated Obs. | Observation Operator | Control Variables | Additional Option |
|--|-------------------------|---|--------------|---|--|---|----------------------------|
| ISBA Multi-layer soil model CO ₂ -responsive version (Interactive vegetation) | Global (2010 – 2018) | ERA-5 Res.: 0.25°x0.25° (LDAS-ERA5) | SEKF | SSM (CGLS ASCAT SWI* + cdf matching) LAI (CGLS GEOV1*) | Second layer of soil (1-4cm) LAI | Layers of soil 2 to 8 (1-100cm) LAI | Coupling with CTRIP (0.5°) |

- Control variables (CVs) are directly updated thanks to their sensitivity to the observed variables
- Other variables are indirectly modified through biophysical processes and feedbacks in the model

Impact of the 2018 heatwave on LSVs: MUDA

Such an extreme event needs more attention!

Using ECMWF high resolution operational analysis to force LDAS-Monde (<u>LDAS-HRES</u>, 0.10°x0.10°) and complement the use of ERA5 (<u>LDAS-ERA5</u>, 0.25°x0.25°)

SSM: strong positive impact from the analysis

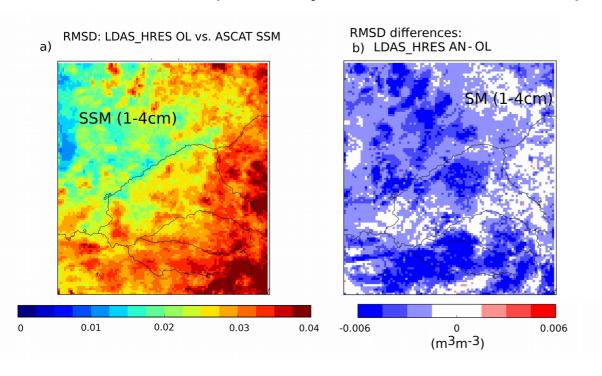

Impact of the 2018 heatwave on LSVs: MUDA

Such an extreme event needs more attention!

- Using ECMWF high resolution operational analysis to force LDAS-Monde (<u>LDAS-HRES</u>, 0.10°x0.10°) and complement the use of ERA5 (<u>LDAS-ERA5</u>, 0.25°x0.25°)
- Forecast up to 8-days ahead : assess the impact of the initial conditions on the Fc

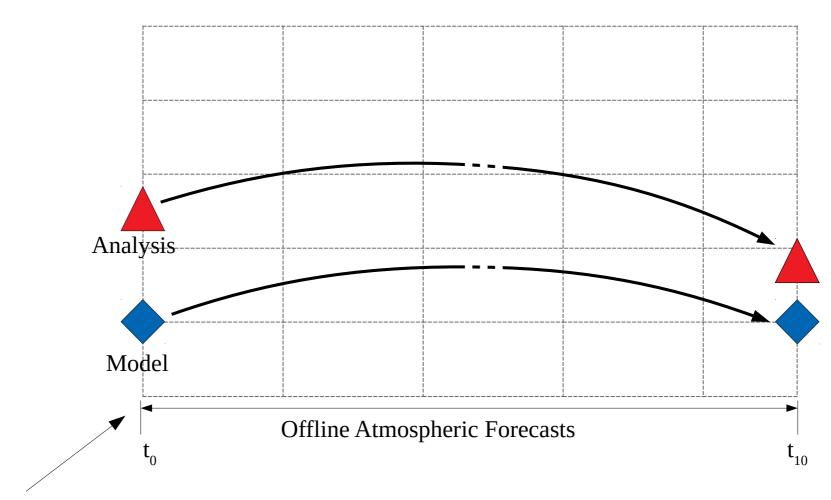

SSM: strong positive impact from the analysis

LDAS-Monde Forecast Implementation

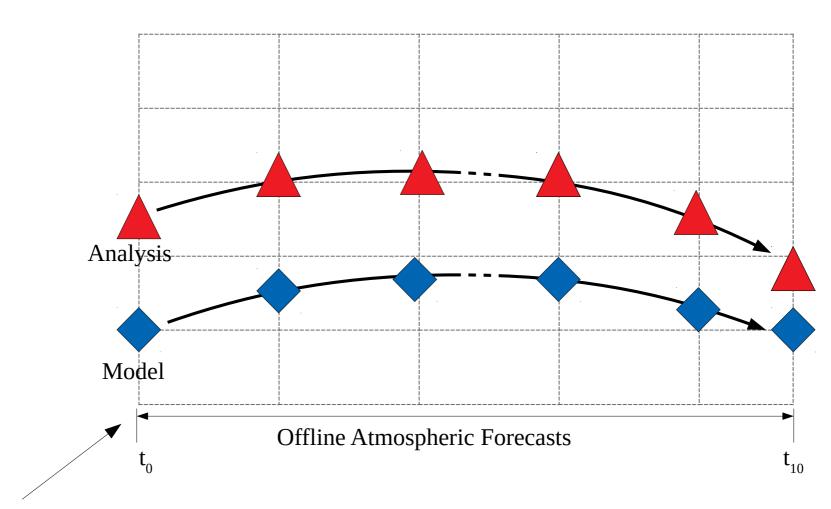

Initial conditions

Up to **10 day** Forecasts

LDAS-Monde Forecast Implementation

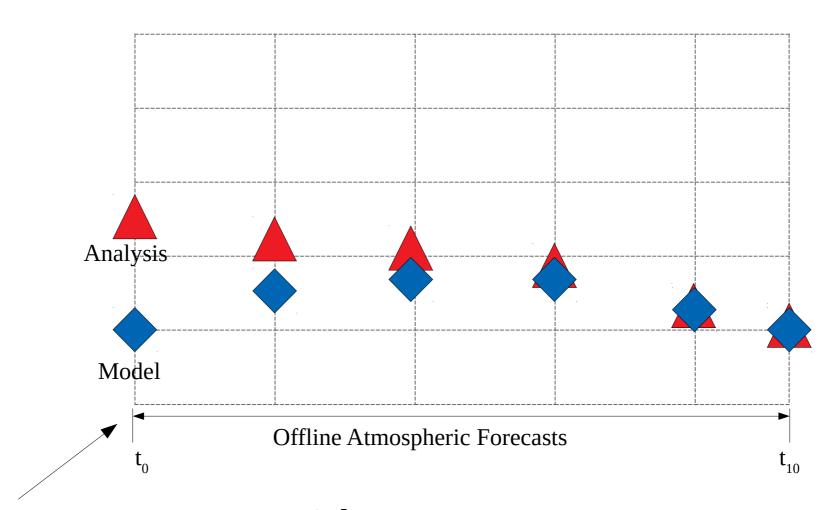

Initial conditions

Up to **10 day** Forecasts Strong impact from the initial conditions

LDAS-Monde Forecast Implementation

Initial conditions

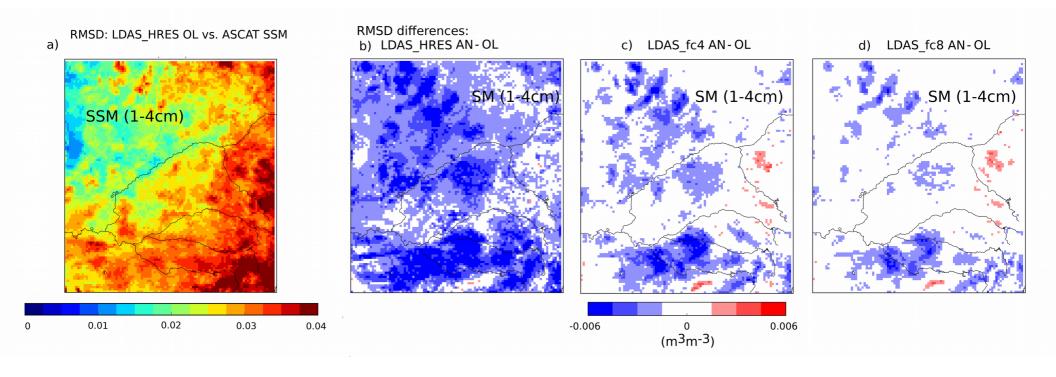

Up to **10 day** Forecasts
Small impact from the initial conidtions, model goes back quickly to its climatology

Impact of the 2018 heatwave on LSVs: MUDA

Such an extreme event needs more attention!

- Using ECMWF high resolution operational analysis to force LDAS-Monde (<u>LDAS-HRES</u>, 0.10°x0.10°) and complement the use of ERA5 (<u>LDAS-ERA5</u>, 0.25°x0.25°)
- Forecast up to 8-days ahead : assess the impact of the initial conditions on the Fc

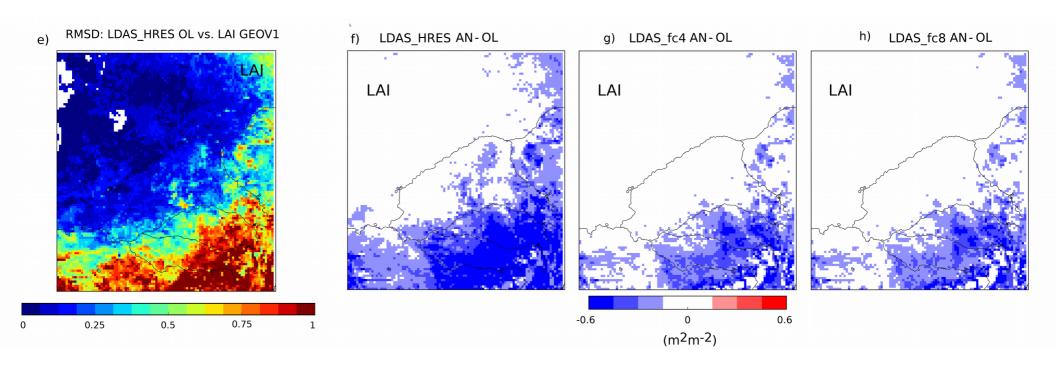

SSM: strong positive impact from the analysis, impact of initialisation seems to vanish quickly

Impact of the 2018 heatwave on LSVs: MUDA

Such an extreme event needs more attention!

- Using ECMWF high resolution operational analysis to force LDAS-Monde (<u>LDAS-HRES</u>, 0.10°x0.10°) and complement the use of ERA5 (<u>LDAS-ERA5</u>, 0.25°x0.25°)
- Forecast up to 8-days ahead initialised by either LDAS-HRES Openloop or Analysis

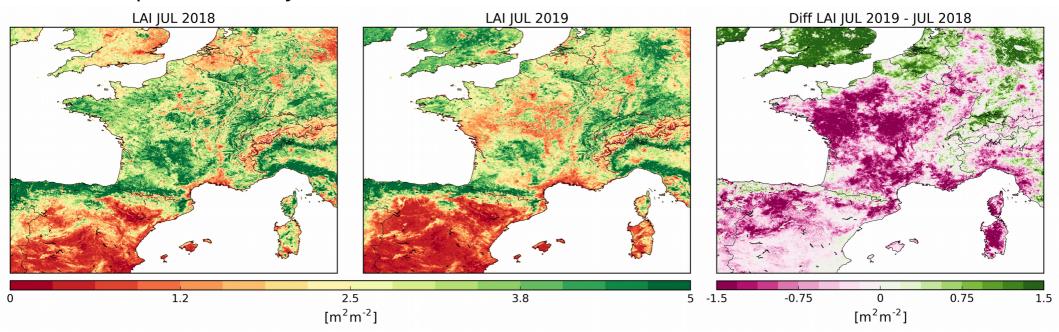

• LAI: strong positive impact from the analysis, strong positive impact from the initialisation

Towards 'higher' spatial resolution

- LDAS-Monde forced by AROME atmospheric fields from Météo-France at 2.5km x
 2.5km spatial resolution (aggregated from 1.3km x 1.3km spatial resolution), assimilation of LAI300 CGLS
- Impact of the July 2019 heatwave

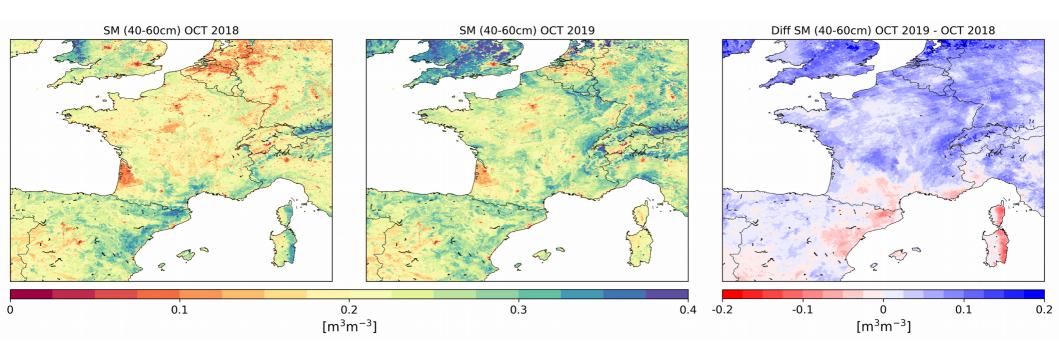

Towards 'higher' spatial resolution

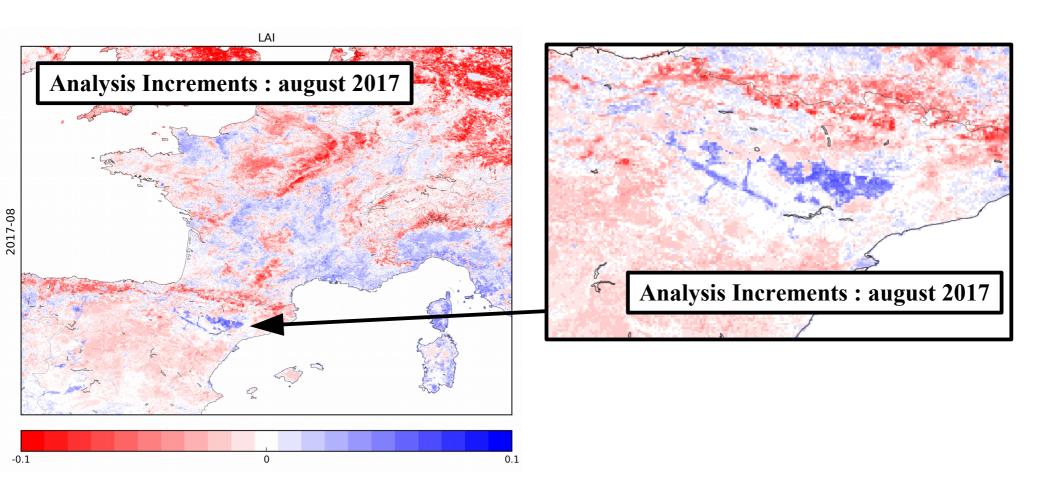

LDAS-Monde forced by AROME atmospheric fields from Météo-France at 2.5km x 2.5km spatial resolution (aggregated from 1.3km x 1.3km spatial resolution), assimilation of LAI300 CGLS

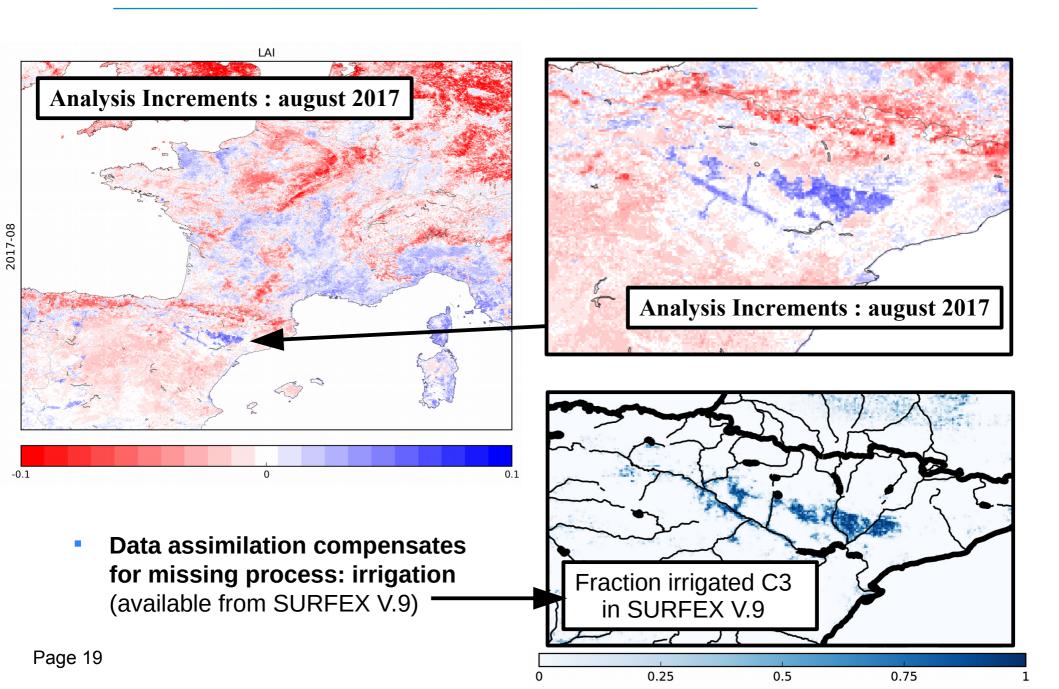

LDAS-Monde: DA peculiar patterns

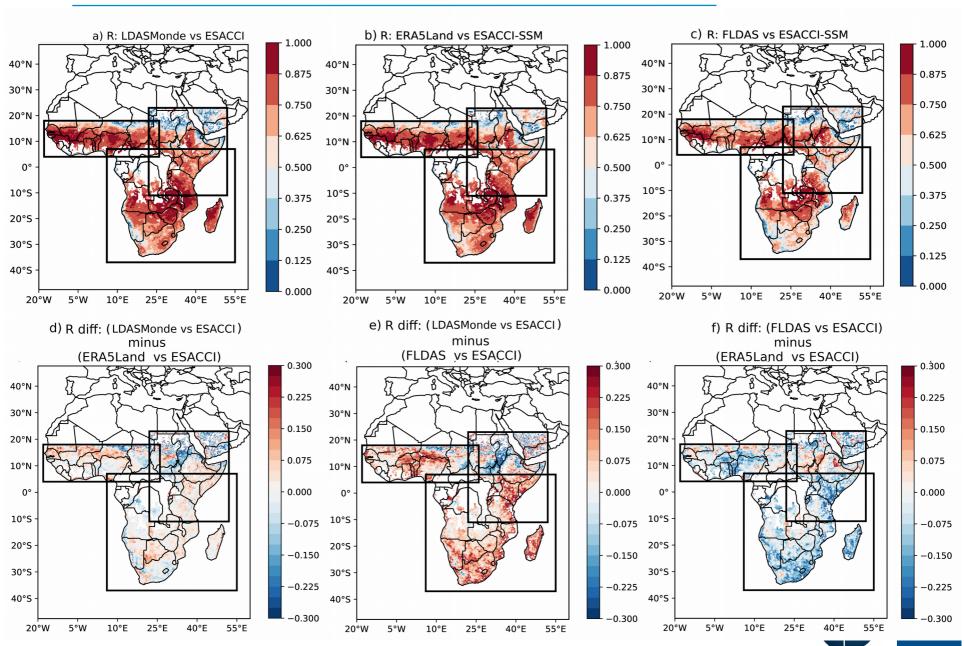

LDAS-Monde: DA peculiar patterns

Evaluation vs ESA-CCI v4.5 Combined product (2017-2018, 10kmx10km)

Conclusions & Prospects

LDAS-Monde: combining LSM, satellite EOs and atmospheric forcing

Great potential to monitor and forecast the impact of extreme weather on LSVs

LDAS-Monde provides a climatology as reference for anomalies of LSVs

→ Significant anomalies trigger more detailed monitoring and forecasting activities at higher spatial resolution

LDAS-Monde ready for use in various applications

- Reanalyses of land ECVs
- Water resource / drought / vegetation monitoring
- Detection of severe conditions over land and initialisation of LSVs forecast

Impact of the initial condition up to 15-d ahead Towards snow data assimilation Assimilation of Level1 data (e.g. sigma0 instead of SSM) Impact of each individual observations (SSM, LAI, sigma0) Al in support of data assimilation (observation operators)

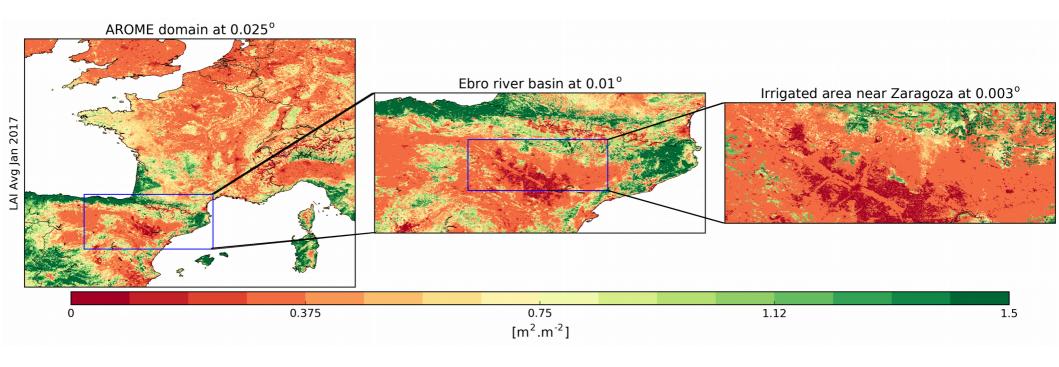

Open LDAS-Monde freely available:

Towards 'higher' spatial resolution

 LDAS-Monde forced by AROME atmospheric fields from Météo-France at different spatial resolution

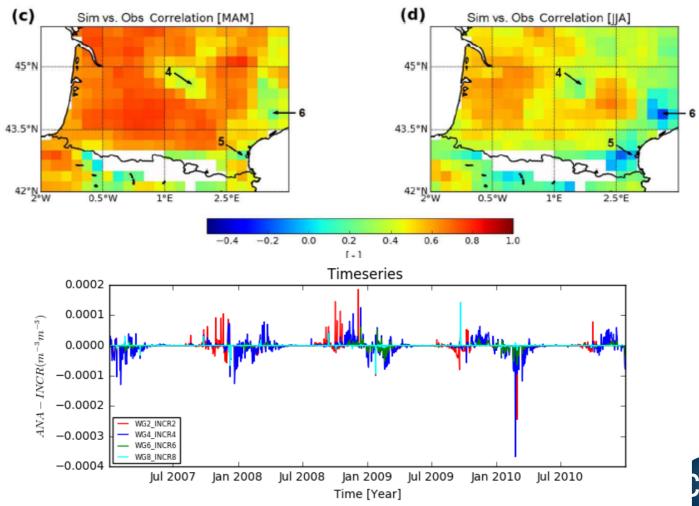

Assimilating new types of observations

ASCAT derived SSM is obtained from radar backscatter measurements :

Assimilating radar backscatter instead of SSM using the Water Cloud Model fed by modelled SSM and LAI

Study the vegetation and terrestrial water cycles

LDAS-Monde: global capacity offline integration of satellite observations into a land surface model fully coupled to hydrology

LDAS-Monde involves

- Land surface model: ISBA-A-gs
- River routing system: CTRIP (CNRM version of Total Runoff Integrating Pathways)
- Data assimilation routines (SEKF, EnSRF, PF)
- Satellite derived observations (SSM, LAI)

ISBA Land Surface Model

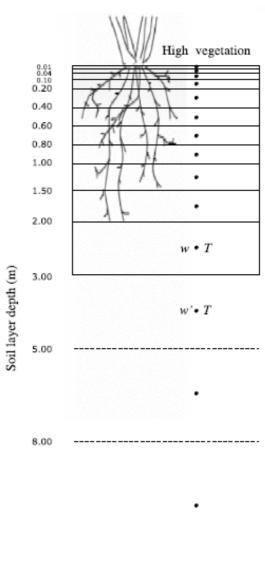

ISBA solves the energy and water budgets at the surface level and describes the exchanges between the land surface and the atmosphere (on a sub-hourly basis)

- ISBA-A-gs (CO₂-responsive version) simulates the diurnal cycle of water and carbon fluxes, plant growth and key vegetation variables
- Phenology driven by photosynthesis
- → LAI is very flexible and can be updated when observations are available
- ISBA-Dif multilayer soil diffusion scheme (14 layers, 12 m)
- ISBA land surface model needs:
 - Parameters for the vegetation and soil texture
 Derived from the ECOCLIMAP-II* landcover database
 - Atmospheric forcing

Longwave & shortwave radiation, 2-metre air temperature & humidity, precipitations (liquid and solid), surface pressure and near surface wind speed

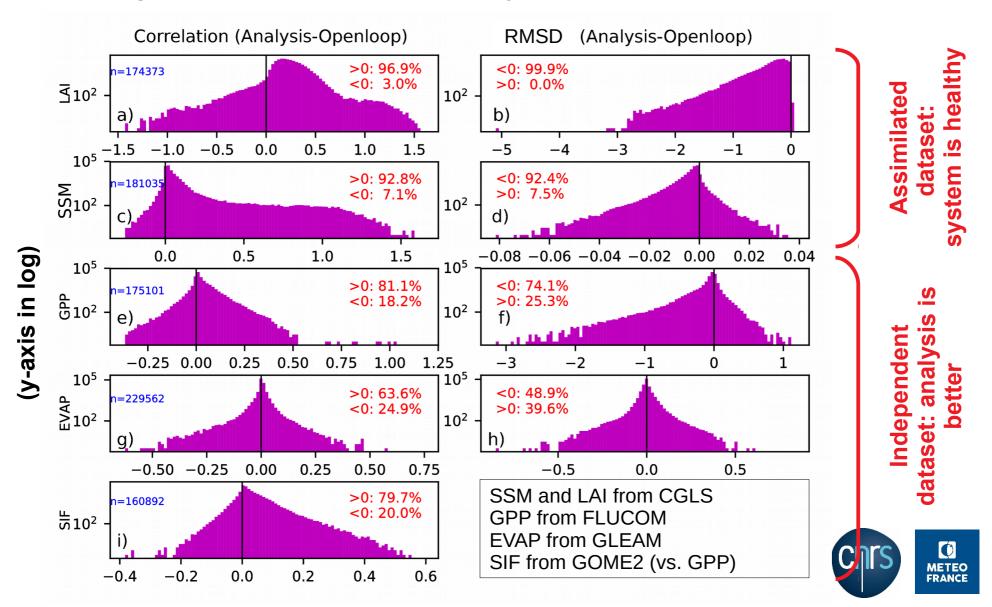

* 1km spatial resolution, ECOCLIMAP-SG already available, 300m resolution

LDAS-Monde global evaluation (in a nutshell!)

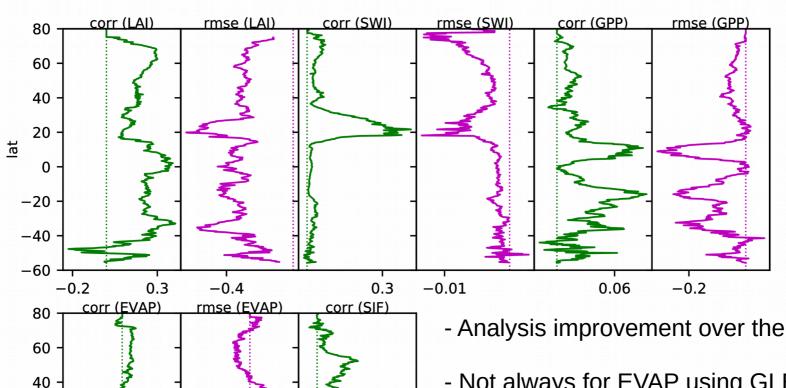

Histograms of score <u>differences</u>: Analysis – Openloop (Correlation, RMSD)

Study the vegetation and terrestrial water cycles

Latitudinal plots of score <u>differences</u>: Analysis – Model (Correlation, RMSE)*

!! DASHED LINE IS THE 0 VALUE !!

0.06

- Analysis improvement over the model run
- Not always for EVAP using GLEAM dataset however first results using Fluxnet2015 insitu measurements tend to show that LDAS-Monde Can be of better quality than GLEAM

*For SIF, only R is used
